

## **Improvisation: an alternative approach to solving the problem of ill-equipped biology and agricultural science laboratories in senior secondary schools, Nigeria**

**Dr. (Mrs) R. Muhammad and N. I. Lawal**

*Department of Science and Vocational Education  
Faculty of Education and Extension Services,  
Usmanu Danfodiyo University, Sokoto*

### **ABSTRACT**

*Effective teaching for quality science education can only be achieved through “learning by doing” (practical) in well-equipped laboratory. However, ill-equipped science laboratories have reached an alarming level thereby making learning by doing impossible. This paper takes a look at the concept and skills or techniques of improvising biology teaching equipment (instructional materials) in Agricultural science as a viable alternative and a panacea to ill-equipped laboratories in post-basic education in Nigeria. The paper concludes that ill-equipped laboratories is one of the myriad of problems currently facing the teaching and learning of Biology and Agricultural science in Nigerian Senior Secondary Schools that needs urgent attention from all stakeholders in science education as government alone cannot solve the problem.*

**KEYWORDS:** *Improvisation: An Alternative Approach To solving the problem of ill-equipped Science laboratories*

Date of Submission: 01-January-2015

Date of Accepted: 20-May-2015

### **I. INTRODUCTION**

*The provision of quality education and by extension quality of life is constitutional and social obligation of government to her citizenry if it is to attain sustainable development. Sustainable development is a development that meets the needs of the present without compromising the ability of future generations to meet their own needs (Arneh, 1990). Wasagu (2009) and Mustapha (2009) opined that science education is a crucial factor and a corner stone for sustainable development in Nigeria. Quality science education is best learnt by doing in the well-equipped laboratory (Nwanosike, & Bayero, 2009).*

Learning by doing as a concept has been described as a learning situation where hand-on and minds-on activities or a concrete sensory experience are used to aid understanding of learning experiences that is student-centered and contrary to traditional lecture pattern of instruction which is teacher-centered (Maduabum 1984 and Ajeyalemi, 2011). Therefore, the government of any nation should foster enabling environment for learning by doing that would guarantee quality science education. This is by making adequate provision of laboratory facilities, equipment and instructional materials that are necessary for scientific learning by doing. Learning by doing (inquiry-based) is advocated in school science by Wasagu (2009) drawing from an ancient proverb which reads thus:

Tell me and I forget  
Show me and I remember  
Let me do it and I understand

However, one can say without fear of contradiction that contemporary science laboratories at post basic education level in Nigeria are grossly ill-equipped thereby making it impossible to ensure the practice which could motivate learning by doing and the generation of globally competitive indigenous scientists. These scientists are capable of assisting in the realization of the Millennium Development Goals (MDGs). Arneh, (1990) stated that most of our secondary school laboratories are poorly equipped. Mustapha (2009) said, teaching facilities such as relevant science textbooks, instructional aids, laboratory equipment etc. are either grossly inadequate or non-functional (obsolete) or not even available at all in some school laboratories. Gyuse, (2009) also observed that facilities, teaching materials, laboratories/workshops equipment and other accessories in our schools setting are part of problems that lead to professional job inefficiency among the Nigerian graduates.

All these perennial problems without doubt translate into difficulties in science teaching-learning and are reflected in the poor performance of students in science as indicated in tables 1 and 2.

**Table 1:** Performance of Students of Sokoto State Science Secondary Schools in West African Examinations Council from 2006– 2010

Year	No. of Candidate	5 Credits with Eng. & Mathematicss	Mean % pass
2006	682	08	1.17
2007	709	10	1.14
2008	741	193	26.04
2009	930	136	14.6
2010	1167	126	10.79
Grand 5 year analysis	4229	473	54.01

The ways out of these problems are numerous but this paper emphasizes on the need for improvisation in a typical Biology and Agricultural science practical in the laboratory.

### **Causes and Consequences of Ill-Equipped Laboratories for Biology and Agricultural Practical in Nigeria**

Nwanosike, (2008) and Eniayegu (2010) opined that in the 1960s and 1970s, the quality of Nigeria's education was the pride of the black race, the envy of many developing and developed nations of the world. After about three decades, the education has plummeted and deteriorated to a mere shadow of its past glory. This turnaround was caused by the following factors:

- i. Systematic mismanagement by three decades of Military rulers who lacked political will, hence, exhibition of lackadaisical attitude towards education issues and trivialization of education (Kolo 2005).
- ii. Underfunding of education had been identified by Uduigwomen & Ozumba (2004) and Kolo (2005) as another cause of ill-supply of laboratory facilities and equipment where they said, the money allocated to education falls short of the United Nations Educational, Scientific and Cultural Organization (UNESCO) recommendation of 26% of annual national budget of every country.
- iii. Ogunniyi *et al.*, (1992) in Eniayeju (2010), stressed that, since the period of Structural Adjustment Program (SAP) to current global financial crisis, the conditions of the world of science education have deteriorated especially in Nigeria.
- iv. Kolo (2005) also mentioned perpetration of endemic and brazen corruption in the education system coupled with geometrical increase in enrolment without concomitant expansion of school facilities and equipment leads to congestion, students outnumbered available equipment and population explosion in our colleges (science colleges inclusive).

- v. Using art inclined personnel to manage science schools, where the personnel see nothing good in spending huge amount of money in purchasing laboratory facilities (Nwanosike, & Bayero, 2009)

## II. CONCEPT OF IMPROVISATION

Improvisation can best be described as an “escape route” or “ a way out” for teacher and the pupils/students, when they are faced with the problem of instructional materials (Maduabum, 1984). It is an attempt to bring the life-like situation into the laboratory in the absence of real objects or materials. Improvisation cannot serve as a substitute for readymade materials or teaching aids. In the process of improvising caution must be taken about the kind or nature and purpose of instructional material the teacher is improvising. The whole mark of improvisation in the process of teaching and learning is to ensure that concepts, ideas and principles are clearly made open and clear to the students through effective display, demonstration and illustration (Okai, Odiachi, Taidi, Garba & Yusuf, 2005). Improvisation could also be defined as using alternative materials or equipment obtainable from the local environment, designed or constructed by the teacher(s) or with the help of local resource person(s) to facilitate instruction (Balogun 1982 in Shehu, Mohammed & Tambuwal 2010). Various authors have further described the concept ‘improvisation’ in different ways Nwanosike, & Bayero, (2009) defined it as the act of substituting for the real thing that is not available. Bajah, (1991) in Ige, (2009) takes it to be the use of substitute equipment where the real one is not available.

### Merits of Using Improvisation in Biology and Agricultural science Teaching and Learning

The following are the advantages of improvisation to science and vocational education.

- [1]. It enhances retention and makes learning permanent.
- [2]. It makes the lesson real and learning more interesting.
- [3]. It enhances creativity on the part of the science teacher and pupils when they are involved,
- [4]. It is cheaper to get than the real object especially imported ones
- [5]. It saves money.
- [6]. It is a source of generating funds for the science teacher as well as for the school.
- [7]. It enhances high mastery of science contents taught on the part of learners (Babajide & Agoro 2010).
- [8]. Techniques of improvisation serve as a scion of entrepreneurial skill for students and hence guarantee self-reliance (Wasagu & Rabi 2009).
- [9]. It inculcates technical skills and practical dexterity on science students to use their hands, heads and hearts to introduce and operate new productive processes for technological invention and economic development (Wasagu & Rabi 2009).

### Sources of Raw Materials for Improvisation

i. **Homes:** They are rich sources of discarded plastics, tins, old calendars, medicine bottle, pots, plates, drinking straws, strings, bulbs, bottle tops, old newspapers, coconuts shells, match boxes and other packaging containers etc (Nwanosike, & Bayero, 2009).

i. **Workshops in the community:** Saw dust and pieces of wood can be collected from the carpenter’s shed. Pieces of rods and metal plates from blacksmith and welders’ workshops, pieces of cloth from the tailor, old wheels, spokes, hubs, metals balls of various sizes from the bicycle repairer, pieces of wire and cables from the electrical workshop. (Nwanosike, & Bayero, 2009).

**Rivers and sea shores:** Where applicable, would yield smooth stones of various sizes, sand, clay, shells and reeds. Farms and forests would give us seeds, nuts, plants, stalk, wood, ropes, bamboo stems etc.(Okai *et al*, 2005).

### Improvisable Materials by Modeling or Charts

S/No.	Description
1	Models and charts
2	Skeletal system
3	Muscular system
4	Brain and nervous system
5	Circulatory system
6	Digestive system
7	Eye and Vision
8	Ear
9	Skin and Excretory Organ
10	Genetic modes

NCCE (2008)

**Table 3:** Some Improvisable Objects for Biology and Agricultural science Teaching and Learning

Improvised Item	Standard Original Item	Purpose
Kerosine Stove	Bursen Burner	Heating
Coca-Cola/Pepsi-Cola plastic Bottle	Measuring Cylinder	Measuring volume
Tea spoon	Spatula	Dispensing
Ear/eye medicine dropper	Dropping pipette	Dropping indicators
Transparent rubber container	Aquarium	Aquatic animals
Disposable syringes	Test Tube	Boiling/testing
Lids of plastic container	Petri dishes	Display/drying
Plastic basin	Trough	Gas preparation
25 liters plastic can (Jeri can)	Installing tap	Water supply
Plastic bottles	Titration flasks	Titration
Hibiscus flower	Methyl orange	Indicator
Lemon juice	Organic acids	Experiments
Dissolved wood ashes	Sodium hydroxide	Titration
Lacasera plastic bottle	Conical flask	Measurements
Dead electric bulb	Round bottom flask	Heating
Drinking straws	Delivery tubes	Experiment
Bottled Lemon juice & Baking powder	Fire extinguisher	Putting off fire
Clay soil	Plasticize	Making models
Dead electric bulb with water	Hand lens	Magnification

**Table 4:** Some selected Biology and Agricultural science materials with techniques of improvising them.

Biological equipment	Local materials that can be used	Procedures/Techniques for improvisation
Dissecting board	Wood, Nail, Flat wood	<ul style="list-style-type: none"> <li>— Cut a rectangular frame from a sheet of wood</li> <li>— Seal each edge of the rectangular frame with small piece of wood using nail</li> </ul>
Quadrat	Wood, Nail, Flat wood	<ul style="list-style-type: none"> <li>— Cut thin slice of wood into four equal pieces</li> <li>— Join the 4 pieces together with nail to form a square</li> </ul>
Wind vane	Metal bar, pipe, bolts and nuts	<ul style="list-style-type: none"> <li>— Place a small pipe on top of a bigger one and weld them together;- place two bars on top of the small pipe and use bolts and nuts to tight them together</li> </ul>
Rain Gauge	2 plastic containers (1 small and 1 big), sand, plastic funnel	<ul style="list-style-type: none"> <li>— Fill a bigger (first) plastic container with sand;</li> <li>— Insert the smaller (second) container inside this;</li> <li>— Insert a third smaller container in the second container</li> <li>— Insert plastic funnel inside the smaller container.</li> </ul>
Vacuum flask	2 plastic or metal containers (1 big and 1 small), sawdust, glue, tin cutter	<ul style="list-style-type: none"> <li>— Remove the bottom of a bigger tin with the aid of the tin cutter;</li> <li>— Insert a medium sized tin into the bigger tin;</li> <li>— Seal the outer surface of the smaller and bigger tins with the mixture of sawdust and glue</li> <li>— Fill the inner surface with sawdust Seal the bottom plate with a mixture of saw dust and glue.</li> </ul>
Aquarium	Glass sheets, Silica gum, Water, Fish, Flower, Air pipe	<ul style="list-style-type: none"> <li>— Cut glass sheet into required sizes Seal the base sheet with the other four sheets to form a cavity leaving the top open</li> <li>— Allow to dry; pour water into the cavity and test for leakage</li> <li>— If there is no leakage, put life fish, air pipe and flowers into the cavity</li> <li>— Seal the cover with silica gum</li> </ul>
Test tube	Fluorescent tube, acetone, Heating apparatus	<ul style="list-style-type: none"> <li>— Cut the tips of the fluorescent tube to expose the inner cavity</li> <li>— Wash the inner cavity with acetone to remove the gas present</li> <li>— Heat the test tube at the middle</li> <li>— When soft, draw the tube to make it thin</li> <li>—</li> </ul>
