# Basian-Markovian Principle in Fitting of Linear Curve 

${ }^{1,}$ Atwar Rahman, ${ }^{2,}$ Dhritikesh Chakrabarty<br>${ }^{1,}$ Department of Statistics Pub Kamrup College Baihata Chariali, Kamrup Assam, India<br>${ }^{2}$, Department of statistics Handique Girls' college Guwahati - 1, Assam, India

#### Abstract

A method of estimation using both of Basian and Markovian principles has been developed in fitting of linear curve to observed data. The method developed has been applied in fitting of linear regression of monthly mean extremum temperature on the monthly average length of day at the five cities namely Guwahati, Dhubri, Dibrugarh, Silchar and Tezpur. It has been found that the application of Basian-Markovian principle in fitting of linear regression of monthly mean extremum temperature on the monthly average length of day is more accurate than the fitting of the same by applying the Basian principle.

KEY WORD: Linear Regression, Basian - Markovian Principle, Extremum Temperature.
Date of Submission: 24-June-2015

Date of Accepted: 05-July-2015

## I. INTRODUCTION:

In fitting a curve to numerical data by the traditional method of least squares, the parameters involved in the curve are estimated first by solving normal equations of the curve and then the estimated values corresponding to the observed values are obtained from the curve using the estimated values of the parameters and the observed values of the independent variable. The principle of obtaining an estimated value of the dependent variable from the estimates of the parameters (involved) and the corresponding value of the independent variable is nothing but the Basian principle. However, in practice there are situations where a value of the associated variable depends on its just preceding value. In such situations, it seems to be more accurate, if the estimated values of the dependent variable are determined on the basis of the just preceding observed value of it. The principle of obtaining an estimated value of the dependent variable from its just preceding observed value is nothing but the Markovian principle. An attempt has been made to determine estimated value of the dependent variable using the Markovian principle. However, since the values of the parameters involved are unknown, they are to be estimated using the entire observed data (since parameter cannot be estimated from single data). The principle of obtaining estimate of parameter from entire data is the Basian principle. Thus, the fitting of curve where parameters are estimated from entire data and estimate of dependent variable is obtained from its just preceding observed value and estimated values of parameters involved can be termed as Basian-Markovian principle. Rahman and Chakrabarty (2007) have innovated a method of fitting exponential curve by Basian-Markovian principle. In another study, Rahman and Chakrabarty (2008) have innovated similar method of fitting Gompertz curve by the same principle. In the current study, a method of estimation using Basian-Markovian principle has been developed in fitting of linear curve to observed data. The method developed has been applied in fitting of linear regression of monthly mean extremum temperature on the monthly average length of day at the five cities namely Guwahati, Dhubri, Dibrugarh, Silchar and Tezpur.

## II. FITTING OF LINEAR CURVE:

The linear curve, more specifically the linear regression of $Y$ on $X$, considered here is of the form

$$
\begin{equation*}
Y=a+b X \tag{2.1}
\end{equation*}
$$

where $a$ and $b$ are the parameters of the curve which are to be estimated from observed data on the pair

$$
\begin{aligned}
& (X, Y) \text { of variables } X \text { and } Y \text {. } \\
& \text { Let the dependent variable ' } Y \text { ' assume the values } \\
& \qquad Y_{1}, Y_{2}, \ldots \ldots \ldots \ldots, Y_{n} \\
& \text { corresponding to the values }
\end{aligned}
$$

$$
X_{1}, X_{2}, \ldots \ldots \ldots \ldots \ldots, X_{n}
$$

of the independent variable ' $X$ ' respectively.
The objective is to estimate the parameters $a$ and $b$ of the linear curve described by the equation (2.1) on the basis of the $n$ pairs

$$
\left(X_{1}, Y_{1}\right),\left(X_{2}, Y_{2}\right), \ldots \ldots \ldots \ldots \ldots,\left(X_{n}, Y_{n}\right)
$$

of observations.

Since all pairs of observations may not lie on the linear curve defined above, the equation (2.1) yields

$$
\begin{equation*}
Y_{i}=a+b X_{i}, \quad(i=1,2, \ldots \ldots \mathrm{n}) \tag{2.2}
\end{equation*}
$$

Now, from (2.2) we have

$$
Y_{i+1}-Y_{i}=b\left(X_{i+1}-X_{i}\right)
$$

which implies

$$
\begin{equation*}
Y_{i+1}=Y_{i}+b \Delta X_{i} \tag{2.3}
\end{equation*}
$$

where

$$
\begin{equation*}
\Delta X_{i}=X_{i+1}-X_{i} \tag{2.4}
\end{equation*}
$$

This is nothing but the recurrence relationship between $Y_{i+1}$ and $Y_{i}$.
This relationship can be suitably applied to determine the estimated value of $Y_{i+1}$ from the observed value of $Y_{i}$.
However, this recurrence relationship contains one parameter namely ' $b$ '. This parameter is to be known for estimating $Y_{i+1}$ from $Y_{i}$.

In order to know the parameter ' $b$ ' one can apply the principle of least squares to the linear curve described by the equation (2.1). On the application of the principle of least squares, the following normal equations are obtained

$$
\begin{aligned}
\sum_{i=1}^{n} Y_{i} & =n a+b \sum_{i=1}^{n} X_{i} \\
\sum_{i=1}^{n} Y_{i} X_{i} & =a \sum_{i=1}^{n} X_{i}+b \sum_{i=1}^{n} X_{i}^{2}
\end{aligned}
$$

Solving these normal equations, one can obtain the estimate of ' $b$ ' as well as of ' $a$ '.

## III. APPLICATION OF THE METHOD TO MAXIMUM AND MINIMUM TEMPERATURE OF FIVE CITIES OF ASSAM.

The method innovated here has been applied to determine the estimated temperatures of five cities in the context of Assam from the data on temperatures collected from the Regional Meteorological Centre at Borjhar, Guwahati.

### 3.1. Monthly Mean Extremum Temperature at Guwahati:

## (A) Estimation of Mean Maximum Temperature

The observed values of the mean maximum temperature $\left(Y_{i}\right)$ corresponding to the average length of day $\left(X_{i}\right)$ for each of the 12 months based on the data from the year 1969 to the year 2010 have been shown in the Table - 3.1.1.

Table - 3.1.1

| Month | Jan | Feb | Mar | April | May | June | July | Aug | Sept | Oct | Nov | Dec |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $X_{i}$ | 10.553 | 11.105 | 11.834 | 12.610 | 13.266 | 13.605 | 13.469 | 12.921 | 12.191 | 11.424 | 10.755 | 10.398 |
| $Y_{i}$ | 23.536 | 26.226 | 29.972 | 30.883 | 31.363 | 31.768 | 31.995 | 32.470 | 31.720 | 30.383 | 27.731 | 24.724 |

The normal equations of the linear curve described by the equation (2.1) in this case become

$$
\begin{aligned}
352.771 & =12 a+144.131 b \\
\& 4271.610108 & =144.131 a+1746.108159 b
\end{aligned}
$$

which yield the least squares estimates $\hat{a}$ and $\hat{b}$ of $a$ and $b$ respectively as

$$
\widehat{a}=1.698023869 \text { and } \hat{b}=2.306198622
$$

Thus, the linear curve fitted to the data in Table - 3.1.1 becomes

$$
\begin{equation*}
Y_{i}=1.698023869+2.306198622 X_{i} \tag{3.1}
\end{equation*}
$$

Also, the recurrence relationship between $Y_{i+1}$ and $Y_{i}$ becomes

$$
\begin{equation*}
Y_{i+1}=Y_{i}+2.306198622 \Delta X_{i} \tag{3.2}
\end{equation*}
$$

Estimated values of $Y_{i}$ obtained by both of the fitted relationship described by the equations (3.1) and (3.2) have been presented in the Table- 3.1.2

Table- 3.1.2

| $X_{i}$ | $Y_{i}$ | $\begin{aligned} & \widehat{Y}_{(B)} \\ & =1.698023869 \\ & +2.306198622 \mathrm{X}_{\mathrm{i}} \end{aligned}$ | $\begin{aligned} & \widehat{Y}_{i+1(B M)}= \\ & Y_{i}+2.306198622 \\ & \Delta X_{i} \\ & \hline \end{aligned}$ | $\left\|\widehat{e}_{(B)}\right\|=\left\|Y_{i}-\widehat{Y}_{(B)}\right\|$ | $\left\|\widehat{e}_{(B M)}\right\|=\left\|Y_{i}-\widehat{Y}_{i+1(B M)}\right\|$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 10.553 | 23.536 | 26.03533793 | - | 2.49933793 | - |
| 11.105 | 26.226 | 27.30835957 | 24.80902164 | 1.08235957 | 1.41697836 |
| 11.834 | 29.972 | 28.98957836 | 27.90721880 | 0.98242164 | 2.06478120 |
| 12.610 | 30.883 | 30.77918849 | 31.76161013 | 0.10381151 | 0.87861013 |
| 13.266 | 31.363 | 32.29205479 | 32.39586630 | 0.92905479 | 1.03286630 |

Mean of the absolute deviations in column $5=1.255949775$
\& Mean of the absolute deviations in column $6=1.155245155$.

## (B) Estimation of Mean Minimum Temperature (Guwahati)

The observed values of the mean minimum temperature $\left(Y_{i}\right)$ corresponding to the average length of day $\left(X_{i}\right)$ for each of the 12 months based on the data from the year 1969 to the year 2010 have been shown in the Table - 3.1.3.

Table - 3.1.3

| Month | Jan | Feb | Mar | April | May | June | July | Aug | Sept | Oct | Nov | Dec |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{X}_{\mathrm{i}}$ | 10.553 | 11.105 | 11.834 | 12.610 | 13.266 | 13.605 | 13.469 | 12.921 | 12.191 | 11.424 | 10.755 | 10.398 |
| $\mathrm{Y}_{\mathrm{i}}$ | 10.815 | 14.849 | 16.087 | 20.488 | 22.793 | 25.045 | 25.660 | 25.635 | 24.650 | 22.057 | 16.982 | 12.226 |

The normal equations of the linear curve described by the equation (2.1) in this case become

$$
\begin{aligned}
237.287 & =12 a+144.131 b \\
\& 2909.964292 & =144.131 a+1746.108159 b
\end{aligned}
$$

which yield the least squares estimates $\hat{a}$ and $\hat{b}$ of $a$ and $b$ respectively as

$$
\widehat{a}=-28.33315945 \quad \text { and } \quad \hat{b}=4.005279318
$$

Thus, the linear curve fitted to the data in Table - 3.1.3 becomes

$$
\begin{equation*}
Y_{i}=-28.33315945+4.005279318 X_{i} \tag{3.3}
\end{equation*}
$$

Also, the recurrence relationship between $Y_{i+1}$ and $Y_{i}$ becomes

$$
\begin{equation*}
Y_{i+1}=Y_{i}+4.005279318 \Delta X_{i} \tag{3.4}
\end{equation*}
$$

Estimated values of $Y_{i}$ obtained by both of the fitted relationship described by the equations (3.3) and (3.4) have been presented in the Table- 3.1.4.

Table- 3.1.4

| $X_{i}$ | $Y_{i}$ | $\widehat{Y}_{(B)}=$ <br> -28.33315945 <br> $+4.005279318 \mathrm{X}_{\mathrm{i}}$ | $\widehat{Y}_{i+1(B M)}=\mathrm{Y}_{\mathrm{i}}+$ <br> $4.005279318 \Delta \mathrm{X}_{\mathrm{i}}$ | $\left\|\widehat{e}_{(B)}\right\|=\left\|Y_{i}-\widehat{Y}_{(B)}\right\|$ | $\left\|\widehat{e}_{(B M)}\right\|=\left\|Y_{i}-\widehat{Y}_{i+1(B M)}\right\|$ |

$\&$ Mean of the absolute deviations in column $6=1.589418986$.

### 3.2. Monthly Mean Extremum Temperature at Dibrugarh:

## (A) Estimation of Mean Maximum Temperature

The observed values of the mean maximum temperature $\left(Y_{i}\right)$ corresponding to the average length of day $\left(X_{i}\right)$ for each of the 12 months based on the data from the year 1969 to the year 2010 have been shown in the Table - 3.2.1.

Table: 3.2.1

| Month | Jan | Feb | Mar | April | May | June | July | Aug | Sept | Oct | Nov | Dec |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $X_{i}$ | 10.553 | 11.105 | 11.834 | 12.610 | 13.266 | 13.605 | 13.469 | 12.921 | 12.191 | 11.424 | 10.755 | 10.398 |
| $\mathrm{Y}_{\mathrm{i}}$ | 23.089 | 23.891 | 26.689 | 27.206 | 29.823 | 31.123 | 31.057 | 31.714 | 30.746 | 29.820 | 27.209 | 24.140 |

The normal equations of the linear curve described by the equation (2.1) in this case become

$$
\begin{aligned}
336.507 & =12 a+144.131 b \\
\& 4074.145399 & =144.131 a+1746.108159 b
\end{aligned}
$$

which yield the least squares estimates $\hat{a}$ and $\hat{b}$ of $a$ and $b$ respectively as

$$
\widehat{a}=2.043788388 \text { and } \quad \widehat{b}=2.164569311
$$

Thus, the linear curve fitted to the data in Table - 3.2.1 becomes

$$
\begin{equation*}
Y_{i}=2.043788388+2.164569311 X_{i} \tag{3.5}
\end{equation*}
$$

Also, the recurrence relationship between $Y_{i+1}$ and $Y_{i}$ becomes

$$
\begin{equation*}
Y_{i+1}=Y_{i}+2.164569311 \Delta X_{i} \tag{3.6}
\end{equation*}
$$

Estimated values of $Y_{i}$ obtained by both of the fitted relationship described by the equations (3.5) and (3.6) have been presented in the Table- 3.2.2

Table - 3.2.2

| $\mathrm{X}_{\mathrm{i}}$ | $\mathrm{Y}_{\mathrm{i}}$ | $\begin{aligned} & \widehat{Y}_{(B)} \\ & =2.043788388 \\ & +2.164569311 \mathrm{X}_{\mathrm{i}} \end{aligned}$ | $\begin{aligned} & \widehat{Y}_{i+1(B M)}=\mathrm{Y}_{\mathrm{i}}+ \\ & 2.164569311 \Delta \mathrm{X}_{\mathrm{i}} \end{aligned}$ | $\left\|\widehat{e}_{(B)}\right\|=\left\|Y_{i}-\widehat{Y}_{(B)}\right\|$ | $\left\|\widehat{e}_{(B M)}\right\|=\left\|Y_{i}-\widehat{Y}_{i+1(B M)}\right\|$ |

## Mean of the absolute deviations in column $5=1.463719091$

\& Mean of the absolute deviations in column $6=1.095751493$.

## (B) Estimation of Mean Minimum Temperature (Dibrugarh)

The observed values of the mean minimum temperature $\left(Y_{i}\right)$ corresponding to the average length of day $\left(X_{i}\right)$ for each of the 12 months based on the data from the year 1969 to the year 2010 have been shown in the Table - 3.2.3.

Table: 3.2.3

| Month | Jan | Feb | Mar | April | May | June | July | Aug | Sept | Oct | Nov | Dec |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{X}_{\mathrm{i}}$ | 10.553 | 11.105 | 11.834 | 12.610 | 13.266 | 13.605 | 13.469 | 12.921 | 12.191 | 11.424 | 10.755 | 10.398 |
| $\mathrm{Y}_{\mathrm{i}}$ | 9.374 | 12.434 | 16.089 | 18.914 | 21.951 | 24.277 | 24.746 | 25.034 | 23.963 | 20.843 | 14.983 | 10.229 |

The normal equations of the linear curve described by the equation (2.1) in this case become

$$
\begin{aligned}
222.837 & =12 a+144.131 b \\
\& 2741.911569 & =144.131 a+1746.108159 b
\end{aligned}
$$

which yield the least squares estimates $\hat{a}$ and $\hat{b}$ of $a$ and $b$ respectively as

$$
\widehat{a}=-33.95633099 \quad \text { and } \quad \widehat{b}=4.373195023
$$

Thus, the linear curve fitted to the data in Table - 3.2.3 becomes

$$
\begin{equation*}
Y_{i}=-33.95633099+4.373195023 X_{i} \tag{3.7}
\end{equation*}
$$

Also, the recurrence relationship between $Y_{i+1}$ and $Y_{i}$ becomes

$$
\begin{equation*}
Y_{i+1}=Y_{i}+4.373195023 \Delta X_{i} \tag{3.8}
\end{equation*}
$$

Estimated values of $Y_{i}$ obtained by both of the fitted relationship described by the equations (3.7) and (3.8) have been presented in the Table- 3.2.4.

Table: 3.2.4

| $\mathrm{X}_{\mathrm{i}}$ | $\mathrm{Y}_{\mathrm{i}}$ | $\widehat{Y}_{(B)}=$ <br> -33.95633099 <br> $+4.373195023 \mathrm{X}_{\mathrm{i}}$ | $\widehat{Y}_{i+1(B M)}$ <br> $\mathrm{Y}_{\mathrm{i}}+4.373195023$ <br> $\Delta \mathrm{X}_{\mathrm{i}}$ | $\left\|\widehat{e}_{(B)}\right\|=\left\|Y_{i}-\widehat{Y}_{(B)}\right\|$ |

\& Mean of the absolute deviations in column $6=1.356749793$

### 3.3. Monthly Mean Extremum Temperature at Dhubri:

## (A) Estimation of Mean Maximum Temperature

The observed values of the mean maximum temperature $\left(Y_{i}\right)$ corresponding to the average length of day $\left(X_{i}\right)$ for each of the 12 months based on the data from the year 1969 to the year 2010 have been shown in the Table - 3.3.1.

Table: 3.3.1.

| Month | Jan | Feb | Mar | April | May | June | July | Aug | Sept | Oct | Nov | Dec |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{X}_{\mathrm{i}}$ | 10.553 | 11.105 | 11.834 | 12.610 | 13.266 | 13.605 | 13.469 | 12.921 | 12.191 | 11.424 | 10.755 | 10.398 |
| $\mathrm{Y}_{\mathrm{i}}$ | 22.362 | 25.748 | 28.486 | 30.605 | 30.900 | 30.932 | 31.031 | 31.696 | 31.027 | 29.459 | 26.486 | 23.276 |

The normal equations of the linear curve described by the equation (2.1) in this case become

$$
\begin{aligned}
342.008 & =12 a+144.131 b \\
\& 4144.870466 & =144.131 a+1746.108159 b
\end{aligned}
$$

which yield the least squares estimates $\widehat{a}$ and $\widehat{b}$ of $a$ and $b$ respectively as

$$
\widehat{a}=-1.232873987 \text { and } \quad \widehat{b}=2.475542998
$$

Thus, the linear curve fitted to the data in Table - 3.3.1 becomes

$$
\begin{equation*}
Y_{i}=-1.232873987+2.475542998 X_{i} \tag{3.9}
\end{equation*}
$$

Also, the recurrence relationship between $Y_{i+1}$ and $Y_{i}$ becomes

$$
\begin{equation*}
Y_{i+1}=Y_{i}+2.475542998 \Delta X_{i} \tag{3.10}
\end{equation*}
$$

Estimated values of $Y_{i}$ obtained by both of the fitted relationship described by the equations (3.9) and (3.10) have been presented in the Table- 3.3.2.

Table: 3.3.2

| $\mathrm{X}_{\mathrm{i}}$ | $\mathrm{Y}_{\mathrm{i}}$ | $\begin{aligned} & \hat{Y}_{(B)}= \\ & -1.232873987 \\ & +2.475542998 \mathrm{X}_{\mathrm{i}} \end{aligned}$ | $\begin{aligned} & \hat{Y}_{i+1(B M)}=\mathrm{Y}_{\mathrm{i}}+ \\ & 2.475542998 \Delta \mathrm{X}_{\mathrm{i}} \end{aligned}$ | $\left\|\widehat{e}_{(B)}\right\|=\left\|Y_{i}-\widehat{Y}_{(B)}\right\|$ | $\left\|\widehat{e}_{(B M)}\right\|=\left\|Y_{i}-\widehat{Y}_{i+1(B M)}\right\|$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 10.553 | 22.362 | 24.89153127 | - | 2.52953127 | - |
| 11.105 | 25.748 | 26.25803101 | 23.72849973 | 0.51003101 | 2.01950027 |
| 11.834 | 28.486 | 28.06270186 | 27.55267085 | 0.42329814 | 0.93332915 |
| 12.610 | 30.605 | 29.98372322 | 30.40702137 | 0.62127678 | 0.19797863 |

| 12.191 | 31.027 | 28.94647071 | 29.88885361 | 2.08052929 | 1.13814639 |
| 11.424 | 29.459 | 27.04772923 | 29.12825852 | 2.41127077 | 0.33074148 |
| 10.755 | 26.486 | 25.39159096 | 27.80286173 | 1.09440904 | 1.31686173 |
| 10.398 | 23.276 | 24.50782211 | 25.60223115 | 1.23182211 | 2.32623115 |

## Mean of the absolute deviations in column $5=1.262194493$

## $\&$ Mean of the absolute deviations in column $6=1.168747773$

## (B) Estimation of Mean Minimum Temperature (Dhubri).

The observed values of the mean minimum temperature $\left(Y_{i}\right)$ corresponding to the average length of day $\left(X_{i}\right)$ for each of the 12 months based on the data from the year 1969 to the year 2010 have been shown in the Table - 3.3.3.

Table: 3.3.3.

| Month | Jan | Feb | Mar | April | May | June | July | Aug | Sept | Oct | Nov | Dec |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{X}_{\mathrm{i}}$ | 10.553 | 11.105 | 11.834 | 12.610 | 13.266 | 13.605 | 13.469 | 12.921 | 12.191 | 11.424 | 10.755 | 10.398 |
| $\mathrm{Y}_{\mathrm{i}}$ | 11.938 | 14.281 | 18.105 | 21.600 | 23.010 | 24.668 | 25.568 | 25.738 | 24.982 | 22.645 | 18.214 | 13.619 |

The normal equations of the linear curve described by the equation (2.1) in this case become

$$
\begin{aligned}
244.368 & =12 a+144.131 b \\
\& 2989.751653 & =144.131 a+1746.108159 b
\end{aligned}
$$

which yield the least squares estimates $\hat{a}$ and $\hat{b}$ of $a$ and $b$ respectively as

$$
\hat{a}=-23.51919938 \text { and } \hat{b}=3.653609512
$$

Thus, the linear curve fitted to the data in Table - 3.3.3 becomes

$$
\begin{equation*}
Y_{i}=-23.51919938+3.653609512 X_{i} \tag{3.11}
\end{equation*}
$$

Also, the recurrence relationship between $Y_{i+1}$ and $Y_{i}$ becomes

$$
\begin{equation*}
Y_{i+1}=Y_{i}+3.653609512 \Delta X_{i} \tag{3.12}
\end{equation*}
$$

Estimated values of $Y_{i}$ obtained by both of the fitted relationship described by the equations (3.11) and (3.12) have been presented in the Table- 3.3.4.

Table - 3.3.4

| $\mathrm{X}_{\mathrm{i}}$ | $\mathrm{Y}_{\mathrm{i}}$ | $\begin{aligned} & \hat{Y}_{(B)}= \\ & -23.51919938 \\ & +3.653609512 \mathrm{X}_{\mathrm{i}} \end{aligned}$ | $\begin{aligned} & \hat{Y}_{i+1(B M)}= \\ & \mathrm{Y}_{\mathrm{i}}+3.653609512 \\ & \Delta \mathrm{X}_{\mathrm{i}} \end{aligned}$ | $\left\|\widehat{e}_{(B)}\right\|=\left\|Y_{i}-\widehat{Y}_{(B)}\right\|$ | $\left\|\widehat{e}_{(B M)}\right\|=\left\|Y_{i}-\widehat{Y}_{i+1(B M)}\right\|$ |
| :---: | :---: | :---: | :---: | :---: | :---: |
| 10.553 | 11.938 | 15.0373418 | - | 3.09934180 | - |
| 11.105 | 14.281 | 17.05413425 | 13.95479245 | 2.77313425 | 0.32620755 |

### 3.4. Monthly Mean Extremum Temperature at Silchar:

## (A) Estimation of Mean Maximum Temperature

The observed values of the mean maximum temperature $\left(Y_{i}\right)$ corresponding to the average length of day $\left(X_{i}\right)$ for each of the 12 months based on the data from the year 1969 to the year 2010 have been shown in the Table: 3.4.1.

Table: 3.4.1

| Month | Jan | Feb | Mar | April | May | June | July | Aug | Sept | Oct | Nov | Dec |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{X}_{\mathrm{i}}$ | 10.553 | 11.105 | 11.834 | 12.610 | 13.266 | 13.605 | 13.469 | 12.921 | 12.191 | 11.424 | 10.755 | 10.398 |
| $\mathrm{Y}_{\mathrm{i}}$ | 24.548 | 26.692 | 29.904 | 30.607 | 31.093 | 31.582 | 31.629 | 32.104 | 31.715 | 30.965 | 28.688 | 25.962 |

The normal equations of the linear curve described by the equation (2.1) in this case become

$$
\begin{aligned}
355.489 & =12 a+144.131 b \\
\& 4297.161584 & =144.131 a+1746.108159 b
\end{aligned}
$$

which yield the least squares estimates $\hat{a}$ and $\widehat{b}$ of $a$ and $b$ respectively as

$$
\hat{a}=7.619180167 \quad \text { and } \quad \hat{b}=1.832075251
$$

Thus, the linear curve fitted to the data in Table - 3.4.1 becomes

$$
\begin{equation*}
Y_{i}=7.619180167+1.832075251 X_{i} \tag{3.13}
\end{equation*}
$$

Also, the recurrence relationship between $Y_{i+1}$ and $Y_{i}$ becomes

$$
\begin{equation*}
Y_{i+1}=Y_{i}+1.832075251 \Delta X_{i} \tag{3.14}
\end{equation*}
$$

Estimated values of $Y_{i}$ obtained by both of the fitted relationship described by the equations (3.13) and (3.14) have been presented in the Table- 3.4.2.

Table: 3.4.2

| $\mathrm{X}_{\mathrm{i}}$ | $\mathrm{Y}_{\mathrm{i}}$ | $\widehat{Y}_{(B)}=$ <br> 7.619180167 <br> $+1.832075251 \mathrm{X}_{\mathrm{i}}$ | $\widehat{Y}_{i+1(B M)}=\mathrm{Y}_{\mathrm{i}}+$ <br> $1.832075251 \Delta \mathrm{X}_{\mathrm{i}}$ | $\left\|\widehat{e}_{(B)}\right\|=\left\|Y_{i}-\widehat{Y}_{(B)}\right\|$ | $\left\|\widehat{e}_{(B M)}\right\|=\left\|Y_{i}-\widehat{Y}_{i+1(B M)}\right\|$ |

| 10.398 | 25.962 | 26.66909863 | 28.03394914 | 0.70709863 | 2.07194914 |

Mean of the absolute deviations in column $5=1.159774993$
\& Mean of the absolute deviations in column $6=1.007069435$
(B) Estimation of Mean Minimum Temperature (Silchar):

The observed values of the mean minimum temperature $\left(Y_{i}\right)$ corresponding to the average length of day $\left(X_{i}\right)$ for each of the 12 months based on the data from the year 1969 to the year 2010 have been shown in the Table - 3.4.3.

Table - 3.4.3

| Month | Jan | Feb | Mar | April | May | June | July | Aug | Sept | Oct | Nov | Dec |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{X}_{\mathrm{i}}$ | 10.553 | 11.105 | 11.834 | 12.610 | 13.266 | 13.605 | 13.469 | 12.921 | 12.191 | 11.424 | 10.755 | 10.398 |
| $\mathrm{Y}_{\mathrm{i}}$ | 12.112 | 13.980 | 17.600 | 21.139 | 23.164 | 24.761 | 25.200 | 25.267 | 24.811 | 23.172 | 18.152 | 13.728 |

The normal equations of the linear curve described by the equation (2.1) in this case become

$$
\begin{aligned}
243.086 & =12 a+144.131 b \\
\& 2973.124095 & =144.131 a+1746.108159 b
\end{aligned}
$$

which yield the least squares estimates $\hat{a}$ and $\widehat{b}$ of $a$ and $b$ respectively as

$$
\hat{a}=-22.63903504 \quad \text { and } \quad \widehat{b}=3.571434462
$$

Thus, the linear curve fitted to the data in Table - 3.4.3 becomes

$$
\begin{equation*}
Y_{i}=-22.63903504+3.571434462 X_{i} \tag{3.15}
\end{equation*}
$$

Also, the recurrence relationship between $Y_{i+1}$ and $Y_{i}$ becomes

$$
\begin{equation*}
Y_{i+1}=Y_{i}+3.571434462 \Delta X_{i} \tag{3.16}
\end{equation*}
$$

Estimated values of $Y_{i}$ obtained by both of the fitted relationship described by the equations (3.15) and (3.16) have been presented in the Table- 3.4.4.

Table- 3.4.4

| $\mathrm{X}_{\mathrm{i}}$ | $\mathrm{Y}_{\mathrm{i}}$ | $\begin{aligned} & \hat{Y}_{(B)}= \\ & -22.63903504 \\ & +3.571434462 \mathrm{X}_{\mathrm{i}} \end{aligned}$ | $\begin{aligned} & \hat{Y}_{i+1(B M)}= \\ & \mathrm{Y}_{\mathrm{i}}+3.571434462 \\ & \Delta \mathrm{X}_{\mathrm{i}} \end{aligned}$ | $\left\|\widehat{e}_{(B)}\right\|=\left\|Y_{i}-\widehat{Y}_{(B)}\right\|$ | $\left\|\widehat{e}_{(B M)}\right\|=\left\|Y_{i}-\widehat{Y}_{i+1(B M)}\right\|$ |

### 3.5. Monthly Mean Extremum Temperature at Tezpur:

## (A) Estimation of Mean Maximum Temperature:

The observed values of the mean maximum temperature $\left(Y_{i}\right)$ corresponding to the average length of day $\left(X_{i}\right)$ for each of the 12 months based on the data from the year 1969 to the year 2010 have been shown in the Table: 3.5.1.

Table: 3.5.1

| Month | Jan | Feb | Mar | April | May | June | July | Aug | Sept | Oct | Nov | Dec |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{X}_{\mathrm{i}}$ | 10.553 | 11.105 | 11.834 | 12.610 | 13.266 | 13.605 | 13.469 | 12.921 | 12.191 | 11.424 | 10.755 | 10.398 |
| $\mathrm{Y}_{\mathrm{i}}$ | 23.559 | 25.976 | 29.397 | 30.015 | 30.895 | 31.867 | 31.900 | 32.197 | 31.587 | 30.680 | 28.195 | 24.716 |

The normal equations of the linear curve described by the equation (2.1) in this case become

$$
\begin{aligned}
350.984 & =12 a+144.131 b \\
\& 4248.336627 & =144.131 a+1746.108159 b
\end{aligned}
$$

which yield the least squares estimates $\hat{a}$ and $\hat{b}$ of $a$ and $b$ respectively as

$$
\widehat{a}=3.002012944 \text { and } \quad \widehat{b}=2.185233188
$$

Thus, the linear curve fitted to the data in Table - 3.5.1 becomes

$$
\begin{equation*}
Y_{i}=3.002012944+2.185233188 X_{i} \tag{3.17}
\end{equation*}
$$

Also, the recurrence relationship between $Y_{i+1}$ and $Y_{i}$ becomes

$$
\begin{equation*}
Y_{i+1}=Y_{i}+2.185233188 \Delta X_{i} \tag{3.18}
\end{equation*}
$$

Estimated values of $Y_{i}$ obtained by both of the fitted relationship described by the equations (3.17) and (3.18) have been presented in the Table- 3.5.2

Table- 3.5.2

| $\mathrm{X}_{\mathrm{i}}$ | $\mathrm{Y}_{\mathrm{i}}$ | $\begin{aligned} & \widehat{Y}_{(B)} \\ & =3.002012944 \\ & +2.185233188 \mathrm{X}_{\mathrm{i}} \end{aligned}$ | $\begin{aligned} & \hat{Y}_{i+1(B M)}= \\ & \mathrm{Y}_{\mathrm{i}}+2.185233188 \\ & \Delta \mathrm{X}_{\mathrm{i}} \end{aligned}$ | $\left\|\widehat{e}_{(B)}\right\|=\left\|Y_{i}-\widehat{Y}_{(B)}\right\|$ | $\left\|\widehat{e}_{(B M)}\right\|=\left\|Y_{i}-\widehat{Y}_{i+1(B M)}\right\|$ |

## Mean of the absolute deviations in column $5=1.307337169$

\& Mean of the absolute deviations in column $6=1.109283682$

## (B) Estimation of Mean Minimum Temperature (Tezpur):

The observed values of the mean minimum temperature $\left(Y_{i}\right)$ corresponding to the average length of day $\left(X_{i}\right)$ for each of the 12 months based on the data from the year 1969 to the year 2010 have been shown in the Table - 3.5.3.

Table: 3.5.3.

| Month | Jan | Feb | Mar | April | May | June | July | Aug | Sept | Oct | Nov | Dec |
| :---: | :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\mathrm{X}_{\mathrm{i}}$ | 10.553 | 11.105 | 11.834 | 12.610 | 13.266 | 13.605 | 13.469 | 12.921 | 12.191 | 11.424 | 10.755 | 10.398 |
| $\mathrm{Y}_{\mathrm{i}}$ | 11.424 | 13.651 | 17.075 | 19.828 | 22.377 | 24.603 | 25.132 | 25.264 | 24.497 | 21.665 | 16.808 | 12.610 |

The normal equations of the linear curve described by the equation (2.1) in this case become

$$
\begin{aligned}
234.934 & =12 a+144.131 b \\
\& 2878.797313 & =144.131 a+1746.108159 b
\end{aligned}
$$

which yield the least squares estimates $\widehat{a}$ and $\widehat{b}$ of $a$ and $b$ respectively as

$$
\hat{a}=-26.19710002 \quad \text { and } \quad \hat{b}=3.811110727
$$

Thus, the linear curve fitted to the data in Table - 3.5.3 becomes

$$
\begin{equation*}
Y_{i}=-26.19710002+3.811110727 X_{i} \tag{3.19}
\end{equation*}
$$

Also, the recurrence relationship between $Y_{i+1}$ and $Y_{i}$ becomes

$$
\begin{equation*}
Y_{i+1}=Y_{i}+3.811110727 \Delta X_{i} \tag{3.20}
\end{equation*}
$$

Estimated values of $Y_{i}$ obtained by both of the fitted relationship described by the equations (3.19) and (3.20) have been presented in the Table- 3.5.4

Table- 3.5.4

| $\mathrm{X}_{\mathrm{i}}$ | $\mathrm{Y}_{\mathrm{i}}$ | $\widehat{Y}_{(B)}=$ <br> -26.19710002 <br> $+3.811110727 \mathrm{X}_{\mathrm{i}}$ | $\widehat{Y}_{i+1(B M)}$ <br> $\mathrm{Y}_{\mathrm{i}}+3.811110727$ <br> $\Delta \mathrm{X}_{\mathrm{i}}$ | $\left\|\widehat{e}_{(B)}\right\|=\left\|Y_{i}-\widehat{Y}_{(B)}\right\|$ |
| :---: | :---: | :---: | :---: | :---: | :---: |$|$|  |

## Mean of the absolute deviations in column $5=2.131860443$

## \& Mean of the absolute deviations in column $6=1.134142265$

## IV. CONCLUSION:

In the fitting of linear regression of monthly mean extremum (maximum and minimum) temperature on the monthly average length of day at the five cities in Assam, the computed values of the mean absolute deviations of the estimated values from the respective observed values, obtained in both types of fitting (namely fitting by Basian principle and fitting by Basian-Markovian principle) have been shown in the following table (Table: 4.1 and Table: 4.2).

Table: 4.1- Maximum Temperature

| City | Mean of absolute deviation |  | Comparison |
| :---: | :---: | :---: | :---: |
|  | Basian Principle | Basian - Markovian Principle |  |
| Guwahati | 1.255949775 | 1.155245155 | Basian > Basian - Markovian |
| Dibrugarh | 1.463719091 | 1.095751493 | Basian > Basian - Markovian |
| Dhubri | 1.262194493 | 1.168747773 | Basian > Basian - Markovian |
| Silchar | 1.159774993 | 1.007069435 | Basian > Basian - Markovian |
| Tezpur | 1.307337169 | 1.109283682 | Basian > Basian - Markovian |

Table: 4.2-Minimum Temperature

| City | Mean of absolute deviation |  | Comparison |
| :---: | :---: | :---: | :---: |
|  | Basian Principle | Basian - Markovian Principle |  |
| Guwahati | 2.214837646 | 1.589418986 | Basian > Basian - Markovian |
| Dibrugarh | 2.305926353 | 1.356749793 | Basian > Basian - Markovian |
| Dhubri | 2.145491684 | 1.343239858 | Basian > Basian - Markovian |
| Silchar | 2.176905501 | 1.324688591 | Basian > Basian - Markovian |
| Tezpur | 2.131860443 | 1.134142265 | Basian > Basian - Markovian |

It is found that the mean absolute deviation of estimated values from the respective observed values in the case of fitting by Basian-Markovian principle is less than the corresponding mean absolute deviation in the case of fitting by Basian principle in the case of both monthly mean maximum and monthly mean minimum temperature at all the five cities of Assam. Thus one can conclude that the application of Basian-Markovian principle in fitting of linear regression of monthly mean extremum temperature on the monthly average length of day is more accurate than the fitting of the same by applying the Basian principle.
